

As a first-year college student, my goal is to create a simple but meaningful website that introduces me to others and showcases who I am. This website will serve as a personal space where I can share important details about myself, including my name, age, and a brief introduction to my personality and aspirations. It will also feature a section dedicated to my hobbies, such as playing sports, dancing, and I plan to include short descriptions and visuals to make it more engaging and relatable. Additionally, the website will highlight my educational journey, providing information about the school I attend, the course I am taking, and what inspired me to pursue this path. I believe this will give visitors a clearer understanding of my background and goals.

The design of the website will reflect a welcoming and approachable vibe. I will use soft colors to create a friendly atmosphere, simple and readable fonts for easy navigation, and visuals like personal photos or icons that represent my hobbies and school life. The website will have three main sections: a homepage with a warm introduction and a photo, an "About Me" page detailing my interests and motivations, and an education section to outline my academic background and achievements.

To build the website, I plan to use HTML for structuring the content and CSS to make it visually appealing. I will rely on the knowledge I've gained from W3Schools to guide me in coding and improving my design. This project is not just about creating a personal website but also about applying what I've learned, enhancing my web development skills, and taking my first step into the world of technology and creativity. Through this website, I hope to connect with others, share my story, and grow both personally and professionally.
